DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 1 – 19 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Correction is required.

3. Claims 1 and 11 refer to the bipolar transistor as being relocated. Where was it moved from?

4. Claim 2 has “which comprises of claim 1”. Does this mean to show dependence on claim 1?

5. Claims 5 and 15 seem to indicate volition on the part of the collector layer in choosing silicon.

6. Claims 8 and 18 include the phrase “as smaller as 10 nm up to unbounded”. Is this an attempt to say greater than or equal to?

Claim Rejections - 35 USC § 103

7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

8. Claims 1, 2, 11 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tsay in view of Morikawa et al. and Jalali-Farahani et al.

Art Unit: 2814

9. Tsay shows (see Figure 4 and column 1, line 52) a pin detector integrated with a bipolar transistor and having p-n junction isolation, formed in silicon. Morikawa et al. show (see Figure 6a and column 3, line 34 et seq.) a SiGe photodetector which can replace the usual InGaAsP detector with a material that is compatible with Si processing (column 1, line 13). Jalali-Farahani et al. show a heterojunction bipolar transistor using SiGe. It would have been obvious to modify the Tsay device to include the Morikawa et al. detector and the Jalali-Farahani et al. transistor to provide an integrated device which can replace the III-V material with a system that is compatible with normal Si processing.
